KEYNOTE SNMP ADAPTER

INTEGRATE KEYNOTE DATA INTO YOUR EXISTING ENTERPRISE CONSOLE

The Keynote SNMP Adapter is a secure, reliable and flexible way of integrating our industry-leading end-user and Internet performance data into Enterprise Management Systems, including:

- Micromuse Netcool
- HP OpenView
- Freshwater Sitescope
- Virtually any SNMP-capable application

Get The Performance Alerts You Need Via SNMP

The Keynote SNMP Adapter integrates our rich Internet performance measurement information into your existing enterprise management console—allowing you to view Web Site Perspective® Business Edition, Transaction Perspective®, and Red Alert™ performance and availability alerts from a single “pane of glass.”

SNMP Adapter Benefits

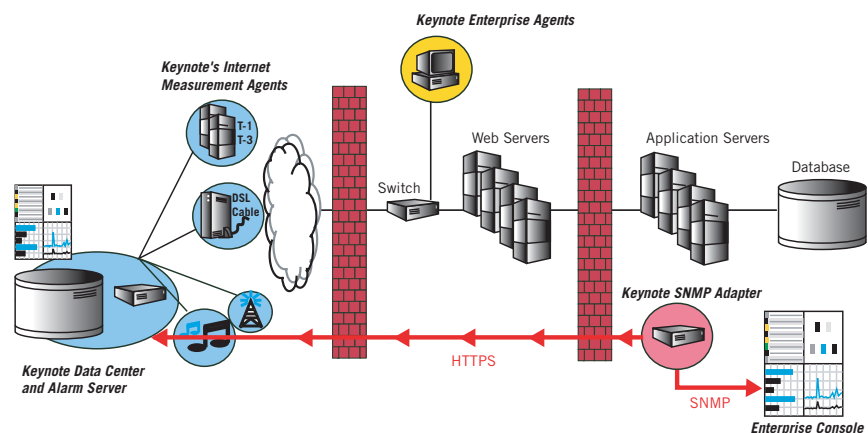

Timely—Fast problem resolution requires timely notification. The SNMP Adapter polls the Keynote data center every minute for any new alerts generated by Keynote's alarm server.

Secure—The SNMP Adapter retrieves alerts using a secure HTTPS/SSL connection, and requires only the outbound SSL port 443 be open.

Reliable—Unlike email (SMTP) alerts that are susceptible to delivery problems, the SNMP Adapter verifies alerts have been received and notifies your console if it is unable to reach the Keynote data center.

Flexible—Once inside your firewall, the SNMP Adapter uses a configurable port/host setting to transform XML alerts into SNMP traps, and feeds them to any EMS or application capable of receiving SNMP events.

Hassle Free—The SNMP Adapter is an appliance that resides on your network. There is no software to install and no upgrades are required.
